Jira backlog with Epics and User Stories :

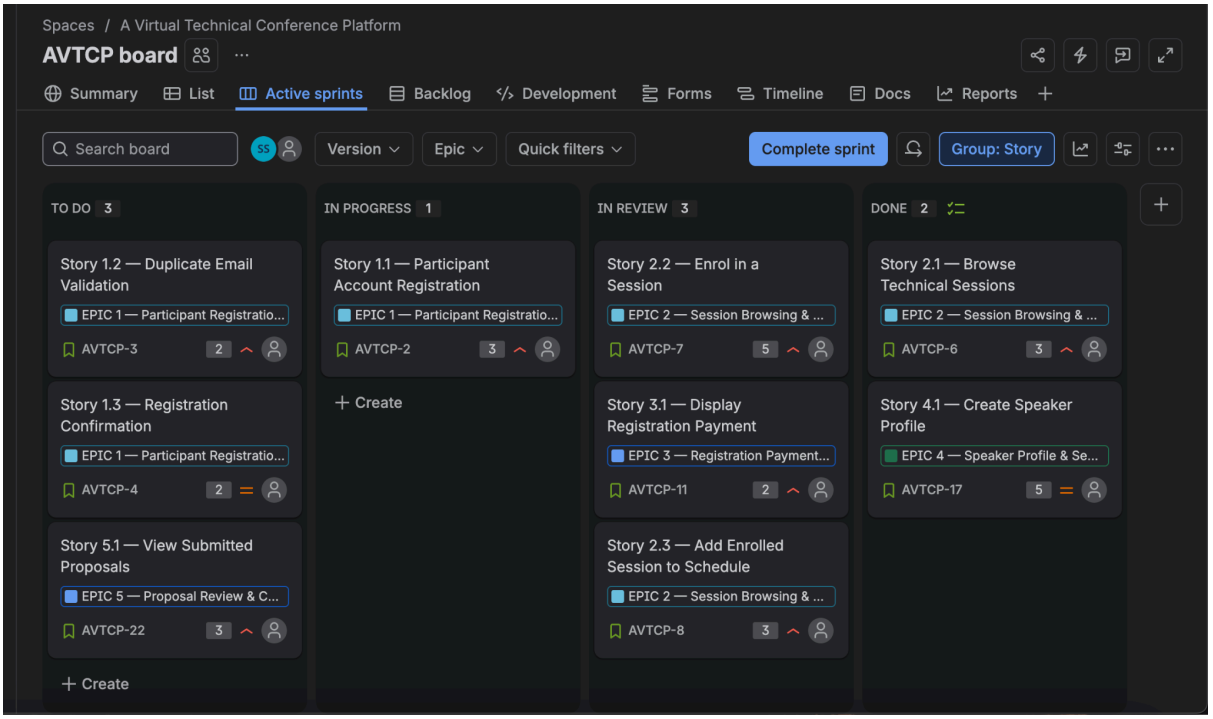

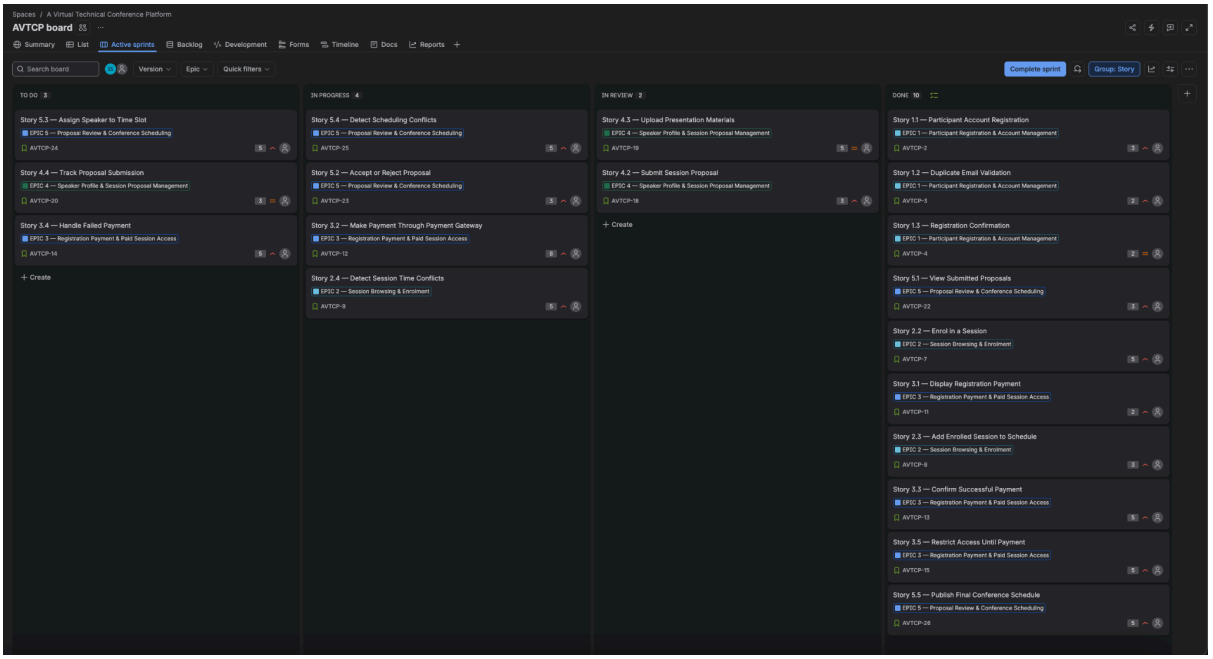

Story point assignments :

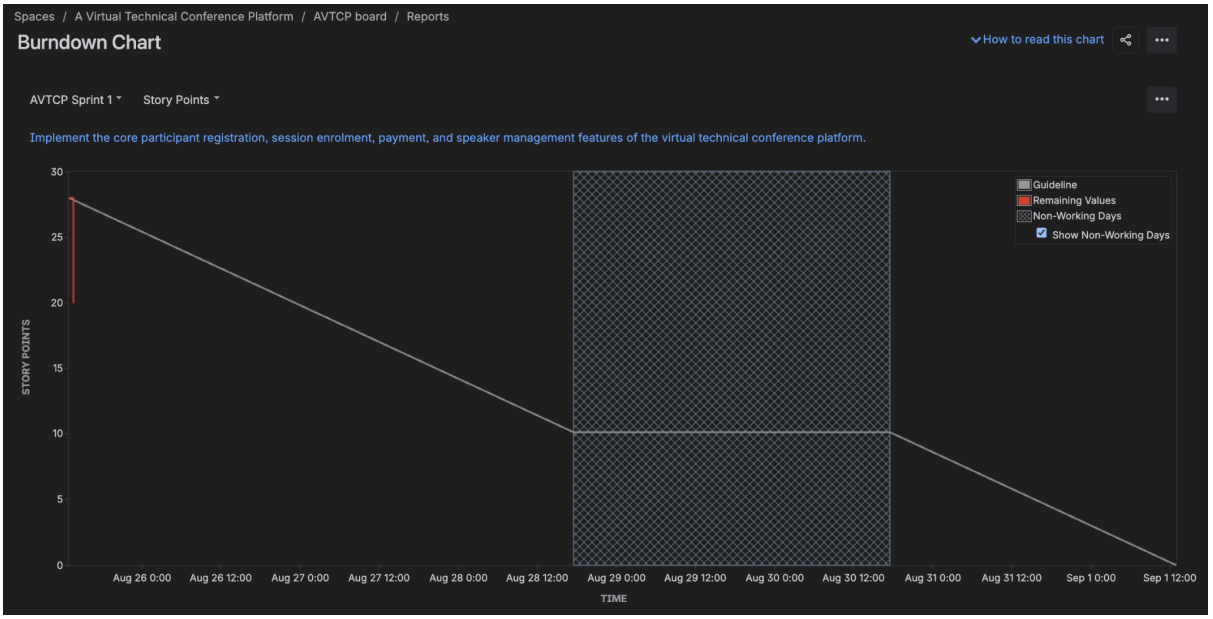

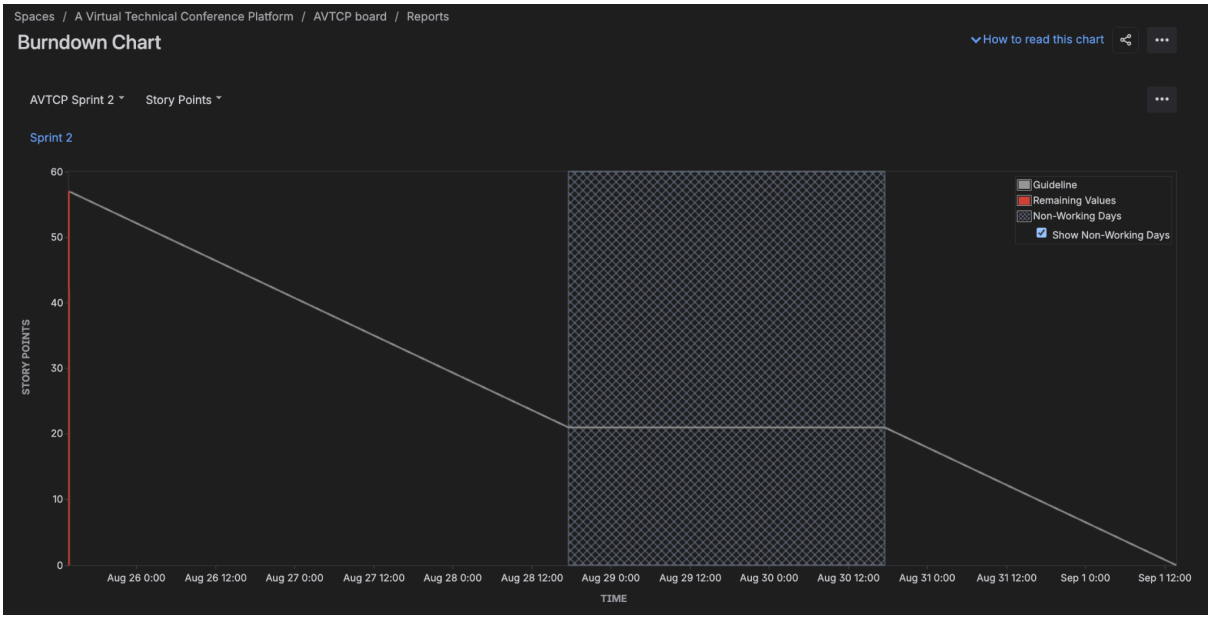

Sprint board (Active Sprint view) :

Burndown Chart :

Reflection Questions :

1. Did your estimations reflect the actual effort?
Overall, the story point estimations reasonably reflected the effort required for each task. Smaller stories were easier to complete, while more complex stories required higher story points. The sprint helped us understand that estimation can vary depending on the complexity of the task.

2. Was your backlog well-prioritized?
Yes, the backlog was prioritized based on the importance and business value of the features. Core features such as registration, session browsing, and enrollment were given higher priority. This helped us focus on the most important functionality first.

3. How did your simulated sprint align with your plan?
The simulated sprint generally followed the planned workflow and selected stories were completed within the sprint. Stories were moved from To Do to In Progress and finally to Done to represent the development process. This showed that the planned sprint was achievable with the selected workload.

4. What insights did the burndown chart give about your team’s capacity?
The burndown chart showed how the remaining work decreased as stories were completed during the sprint. It helped us understand the team's progress and overall capacity. It also showed whether the amount of work planned for the sprint was realistic.
